

Rediscovering Natural Redesdale

Redesdale supports many habitats and species of local, national and international importance, but data on these is often missing. This causes problems for conservation and presents a threat to the valley's natural heritage. Baseline data is essential to monitor population changes of key species (such as bees) and if locations of key species are not known then land management cannot be tailored to their requirements, leading to long-term declines. Important areas may even be inadvertently destroyed because their presence is not known.

We're working to get more biological records for Redesdale and providing training and support to get more people involved in wildlife recording.

Get involved in this project!

- Learn about wildlife in your area, perhaps at one of our events
- Get recording! You just need to know 'What, Where and When!'
Enter your wildlife sightings at: www.ericnortheast.org.uk
